

ABSTRACT

An axially actuated drain valve for pools and spas mountable in a wall thereof. It includes a tubular body and a coaxial plunger. The body opens into the spa or pool at an inner end. The plunger has a passage opening at the outer end of the passage. A cylindrical seal with substantial axial length seals with a seal on the plunger for a substantial range of movement to keep the valve closed. Beyond that, the plunger passage is opened for flow from the body passage opening.
